

Setup Instructions for Aperture VMAN

1. Install Drupal 7 on your hosting
 - a) If you are using godaddy, the steps are as follows:
 - Login to GoDaddy
 - Select the "All Products" item on the left of the menu
 - From the options, select "My Account"
 - Select "Web Hosting"
 - Select the launch button from the Web Hosting section
 - Under "Options & Settings", in the "Tools" section, select "FTP File Manager"
 - In the FTP File Manager, select Create New Directory to create the new Drupal instance directory.
 - In the menu at the top, mouseover Popular Apps and select Drupal
 - Select Install Now on the Drupal product page, follow the setup steps for installing Drupal
2. Download a copy of Aperture VMAN using git.
 - a) `git clone git://github.com/psu-capstone-aperture/aperture-vman.git`
 - b) `cd aperture-vman`
 - c) `git submodule update --init`
3. Copy the contents of the aperture-vman directory into the directory containing your drupal install, overwriting any files where there are conflicts.
4. Install the database file 'backup.sql'
 - a) `cat backup.sql | mysql -u <a valid database user> -p <your drupal database name>`
 - b) Alternatively, use phpmyadmin's import function to import the database.
5. Change the administrator password (administrative username: sysadmin).
 - a) Generate a suitable password hash.
 - `<drupal install directory>/scripts/password_hash.sh <your password>`
 - b) Insert it into the database.
 - `mysql -u <a valid database user> -p`
 - `UPDATE users SET pass = '<your generated password hash>' WHERE uid = 1;`
6. Log in and make any necessary configuration changes.
 - a) In Configuration > Site Information, change the site name and e-mail address.
 - b) In Structure > Contact Form, change the e-mail address.
